(54) AROMATIC COMPOUND

(57) Abstract

PROBLEM TO BE SOLVED: To provide a novel aromatic compound which has a potent FXa inhibition action and quickly exhibits a sufficient and sustained antithrombotic effect when orally administered.

SOLUTION: This compound is represented by the formula (1):  $Q^1-Q^2-A^0-Q^3-A^{00}Q^4$  [wherein  $Q^1$  is an optionally substituted saturated or unsaturated five- or six-membered cyclic hydrocarbon group, or the like;  $Q^2$  is a single bond, or the like;  $Q^3$  is phenylene or a divalent two- to seven-membered heterocyclic group;  $Q^4$  is an aryl group, or the like; and  $A^0$  and  $A^{00}$  are each carbonyl group or the like]. A derivative thereof such

as a salt, a solvate, or an N-oxide is derived from the compound. The compound or its salt, solvate, or N-oxide is useful as a prophylactic and/or a therapeutic agent against cerebral infarction, cerebral embolus, myocardial infarction, angina pectoris, pulmonary infarction, Buerger disease (thromboangiitis obliterans), deep venous thrombosis, disseminated intravascular coagulation, the formation of a thrombus after replacement of an artificial valve or joint, systemic inflammatory response syndrome (SIRS), multiple organ dysfunction syndrome (MODS), the formation of a thrombus during extracorporeal circulation or the blood coagulation during the collection of blood.
